This peptide is a tyrosine-contg. mol. representing a site of tyrosine phosphorylation. The peptides of the invention comprise a portion of the intracellular region of the human hepatocyte growth factor receptor (hHGFR), and can generally reproduce potential recognition motifs for the SHZ domains of intracellular (cytosolic) signal inducers. The peptides can interfere with pathways leading to cell proliferation, movement and extracellular matrix invasion. They can be used to inhibit growth of neoplastic cells and to prevent metastatic spreading. (Updated on 25-MAR-2003 to correct PN field.)
                     New peptide(s) which bind to a cytosolic signal transducer - used for interfering with pathways leading to cell proliferation and motility, treating neoplastic disease.
                                                                                                                        Claim 10; Page 64; 19pp; English

Non-phosphorylated peptide(s) that bind Src Homology 2 domain of signal transducing protein - at least as well as natural phosphorylated target, particularly from treatment of cancer.

Disclosure; Page 9; 39pp; English.

The present sequence represents a SHC phosphopeptide that is capable of binding to the src homology 2 (SH2) domain of Grb2. Gab2 is a signal transduction protein. The specification describes a non-phosphorylated peptide (AAW46896) that binds to the SH2 domain of Grb2 with affinity

```
The invention relates to analysing the activity or level of one or more proteins or enzymes, comprising providing a pool of substrates (e.g. peptides, antibodies, binding domains or other molecules which act as ubstrates or control substrates), each with a specific tag and representing a substrate of one or more of the proteins or enzymes, or substrates derived from these using the tagged substrates as substrates, or hybridising the pool of tagged substrates on ordered array of specific and complementary tagg immobilised on a surface, where the array comprises different tags, at least some of which are control tags, each tag is localised in a predetermined region of the surface and the density of different tags is greater than 100 different tags per square centimetre, and all tags in the substrates derived using the proteins or different each all tags in the substrates tagged with nucleic acids or peptide nucleic acids (PNAs) to the array, where the quantification is proportional to the activity of proteins or enzymes which modify or attach to the substrates tagged with nucleic acids or bras. The method can be used for detection of post-translationally modified proteins and for identifying target proteins capable of binding to, or serving as,
                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis of protein or enzyme activity in samples, e.g., biopsies, comprises using a pool of tagged substrates which can then be sorted onto
similar to, or greater than, that of the present sequence. This non-phosphorylated peptide contains a tyrosine residue that has not been modified by phosphate or similar charged group. The non-phosphorylated peptide is used to inhibit a signal transduction process that involves binding of a phosphorylated protein or peptide to the SH2 domain of a signal transduction protein, particularly GPD2. It is used specifically for treatment of hyper-proliferative diseases, especially human cancer
                                                                                                                                                                                                                                                              Gaps

be used, e.g., for analysing biopsies from cancers and other multifactorial diseases. They can be used to identify previously unknown proteins or new substrates. The use of tagged substrates rather than immobilised substrates. The use of tagged substrate rather than immobilised substrates leads to increased stability of the substrate, improved quality control and lower production costs. The tagged substrates can be kept lyophilised until use, separate from other tagged substrates. The quality of each tagged compound can be verified at any stage. The quality of each tagged compound can be verified at any stage. The quality of each tagged compound can be verified at any stage. The quality of each tagged compound can be verified at any stage. The quality of each tagged compound can be verified at any stage. The quality of sam be changed, refined or differentially labelled at any time, without the need for designing or printing a new tag array. The present sequence is a hybridised array sequence which is attached to a solid support via its 5' amide modification. The sequence a target peptide-nucleic acid sequence (PNA) which comprises a peptide derived from a human cancer related protein and a nucleic acid sequence complimentary to the bound nucleic acid sequences presented as AAS16066-AAS16083 and is used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 9 AA;

Analysis of protein or enzyme activity in samples, e.g., biopsies, comprises using a pool of tagged substrates which can then be sorted onto a solid surface array after reaction.

Example 3; Page 7; 36pp; English.

proteins or enzymes, comprising providing a pool of substrates (e.g. peptides, antibodies, binding domains or other molecules which act as substrates or control substrates), each with a specific again representing a substrate of one or more of the proteins or enzymes, or substrates derived from these using the tagged substrates as substrates, hybridising the pool of tagged substrates to an ordered array of specific and complementary tags immobilised on a surface, where the array comprises different tags, at least some of which are control tags, each tag is localised in a predetermined region of the surface and the density The invention relates to analysing the activity or level of one or more AAUI 0458

of different tags is greater than 100 different tags per square centimetre, and all tags in the substrates derived using the proteins or canzymes are complementary to at least some of the immobilised tags, canzymens are complementary to at least some of the immobilised tags, complementary to at least some of the immobilised tags, complementary to the array, where the quantification is pertidentical to the activity of proteins or enzymes which modify or attach to the substrates tagged with nucleic acids or PNAs. The method can be used for detection of post-translationally modified proteins and compress or molecular adapters involved in biological functions. They can be used, e.g., for analysing biopsies from cancers and other or multifactorial diseases. They can be used to identify previously unknown proteins or new substrates. The use of tagged substrates rather than immobilised substrates leads to increased stability of the substrates. The use of tagged substrates. The use of tagged substrates. The quality of each tagged compound can be verified at any stage. The quality of each tagged compound can be verified at any stage. Substrates can be changed, refined or differentially labelled at any trage trime, without the need for designing or printing a new tag array. The present sequence is a hybridised array sequence which is attached to a solid support via its 5' amide modification. The sequence a target complimentary to the bound nucleic acid sequences presented as AASI6066-complimentary to the bound nucleic acid sequences complimentary to the bound nucleic acid sequences are negated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

AAE15236 standard; peptide; 9 AA. RESULT 15 AAE15236

(first entry) 07-MAR-2002 AAE15236;

SHC phospho peptide, used to determine pTyr mimetics.

N-oxalyl peptide; therapeutic; prophylactic; treatment; psoriasis; downstream signal transduction pathway; tumour.

Unidentified

Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          d
                                                                                                                                                                                                                            ö
                       The present invention relates to pharmaceutically active compounds comprising N-oxalyl peptide structure. The compounds of the invention are used in the therapeutic or prophylactic treatment of warm-blooded animal or human body e.g. tumour and psoriasis. They are useful in the diagnostic treatment of diseases depending on the downstream signal transduction pathway. The present sequence is sire phospho peptide which is used to determine pTyr mimetics in the context of Grb2 SH2 inhibitors. This peptide is used in the exemplification of the invention

polypeptides at least 80% identical to the ORFI-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies oblypeptides, methods of screening for modulacors of GNFX expression or activity, and methods of screening for modulacors of GNFX expression or activity, and methods of screening individuals for a predisposition or call differentiation, immune modulation, hematopoidesis regulation, cell differentiation, immune modulation, hematopoidesis regulation, tissue growth, angiogenesis, activin or inhibin activity, chemotractic/confemblinetic activity, hemostatic activity, tumour inhibition activity, receptor/ligand, antiinflammatory activity, tumour inhibition activity, receptor/ligand, antiinflammatory activity, tumour inhibition activity, employed in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, other proliferative disorders such as pooriasis and benign tumours, curvinglicy and antibodies may be used in the treatment of cancers, other proliferative disorders such as pooriasis and benign tumours, cardiovascular disease, immune system disorders related to organ transplantation, disorders of tissue growth and regeneration, disease, there are all the properties and cholester mellitus, hypothyroidism, and cholester)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             storage disease, and infectious diseases caused by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          signal transduction; protein tyrosine kinase; phosphotyrosine; growth factor receptor; oncogene; cellular growth; cell proliferation; metabolic control; diabetes; PTK; proto-oncogene; insulin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method has been developed of inhibiting a site-specific interaction between a first molecule having an SH2 domain and a second molecule that interacts with the SH2 domain. The method comprises contacting the first molecule with a 4- to 30-mer peptide containing a sequence of formula: R1 molecule having a hydrolysis-resistant phosphotous moiety, and R3 = any anioque having a hydrolysis-resistant phosphotous moiety, and R3 = any anio acid. AAW78501 to AAW78523 represent specifically claimed examples of the peptides described. The peptides are useful for modulating both cellular growth to control unwanted cell proliferation in e.g selected malignancies and for metabolic control in e.g. diabetes, by inhibiting signal transduction molecules such as protein tyrosine kinases (PTKs) which include growth factor receptors, proteo-oncogene and oncogene products and the insulin receptor. The peptides are also useful for treating and for studying the enzymatic mechanisms of PTPase activity and the metabolic content peptides given in the present invention, but which are not specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                              Inhibiting site-specific SH2 domain interaction - with peptide containing phosphotyrosine or phosphotyrosine mimic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         signal transduction; protein tyrosine kinase; phosphotyrosine; growth factor receptor; oncogene; cellular growth; cell proliferation; metabolic control; diabetes; PTK; proto-oncogene; insulin receptor.

A method has been developed of inhibiting a site-specific interaction between a first molecule having an SH2 domain and a second molecule that interacts with the SH2 domain. The method comprises contacting the first molecule with a 4- to 30-mer peptide containing a sequence of formula: RI molecule with a 4- to 30-mer peptide containing a sequence of formula: RI analogue having a hydrolysis-resistant phosphorous moiety, and R3 = any anion acid. AAW78501 to AAW78512 represent specifically claimed examples of the peptides described. The peptides are useful for modulating both cellular growth to control unwanted cell proliferation in e.g selected malignancies and for metabolic control in e.g. diabetes, by inhibiting signal transduction molecules such as protein tyrosine kinases (PTKS) which include growth factor receptors. The peptides are also useful for treating and for studying the enzymatic mechanisms of PTPase activity and the metabolic and biochemical roles of PTPases. AAW78522 represent other peptides given in the present invention, but which are not specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                         Inhibiting site-specific SH2 domain interaction - with peptide containing phosphotyrosine or phosphotyrosine mimic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SH2 domain; binding; inhibition; interaction; site specific; signal transduction; protein tyrosine kinaee; phosphotyrosine; growth factor receptor; oncogene; cellular growth; cell proliferation; metabolic control; diabetes; PTK; proto-oncogene; insulin receptor.

```
A method has been developed of inhibiting a site-specific interaction between a first molecule having an SH2 domain and a second molecule that interacts with the SH2 domain. The method comprises contacting the first conteracts with the SH2 domain. The method comprises contacting the first concerned with a 4- to 30-mer peptide containing a sequence of formula: R1 - Met-R3-Met (1), where R1 = phosphotyrosine (pTyr) or a phosphotyrosine analogue having a hydrolysis-resistant phosphotous moiety, and R3 = any amino acid. AAW78501 to AAW78523 respresent specifically claimed examples of the peptides described. The peptides are useful for modulating both cellular growth to control unwatted cell proliferation in e.g selected malignancies and for metabolic control in e.g. diabetes, by inhibiting signal iransduction molecules such as protein tyrosine kinases (PTKs) which include growth factor receptor. The peptides are also useful for treating and for studying the enzymatic mechanisms of PTPase activity and the metabolic content processent other peptides given in the present invention, but which are
                                                                      Inhibiting site-specific SH2 domain interaction - with peptide containing phosphotyrosine or phosphotyrosine mimic.

Bush D; Breton G, WPI; 2003-576092/54. N-PSDB; ADA31345 New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for plants.

Example; SEQ ID NO 6758; 328pp; English

```
0
           The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of compounds for the ability to interfere with the A. baumannii and other Acinetobacter species in a sample, in screening or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

ö New isolated protein complexes useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of disease disorder.

Disclosure; SEQ ID NO 589; 17pp + Sequence Listing; English.

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise which is attached thereto from cells. Such protein complexes may comprise to to distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM

and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enterococcus faccium encoding an Enterococcus faccium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for disgnosing pathological conditions resulting from B. faccium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and antigonists. The nucleic acid is useful for recombinant production of Candida albicans nucleic acid is useful for recombinant production of candida albicans derived peptides or antisense polypeptides. New Acinetobacter baumanii proteins and mucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii present sequence represents the amino acid sequence of an A. baumannii protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibitied by the artisty of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of the pathway in which a proliferation required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolifing the extent to pathway in which a proliferation required for compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolifing the extent to product is overexpressed, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense uncleic acids required for proliferation in cells other than S, aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to an isolated nucleic acid comprising any one of
Antisense; prokaryotic essential gene; cell proliferation; drug design.

```

```
Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; testicular antigen; testes; cancer; metastasis; immune disorder; reproductive system disorder; urinary system disorder; gene therapy; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disease; infection; cytostatic.

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA, Barash SC, Ruben SM

WPI; 2001-483232/52

Nucleic acids encoding 973 human testicular antigen polypeptides, useful for preventing, diagnosing and/or treating testicular cancer.

Claim 11; SEQ ID NO 1264; 766pp; English.

The present invention provides the protein and coding sequences of 973 muman testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the invention

Claim 8; SEQ ID NO 11022; 2537pp + Sequence Listing; English.

Claim 1; SEQ ID NO 10; 609pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 fulllength cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprisentary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide on the complementary to a
polynucleotide comprises a 3'-end sequence, where the
complementary strand of a polynucleotide on a sequence
complementary strand of a polynucleotide on a sequence
complementary strand of a polynucleotide on a sequence
complementary strand of a polynucleotides
complementary strand of sequences
complementary strand of sequences
complementary strand of the primers
complementary strand of the primers
complementary strand present invention

This invention relates to nucleic acid sequences AAF93744 - AAF93916
which encode human secretory or membrane proteins represented by AAB88317
- AAB88419. Included in the invention are primers AAF93917 - AAF94295 and
AAF62232 - AAF62235 which are used to isolate the cDNA sequences of the
invention. The invention also includes methods for the production of
antibodies directed against the proteins, and cDNA sequences, which can
be used in vaccines. The polymucleotide sequences can be used in gene
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences and the proteins associated
with inappropriate secretory protein/membrane protein expression. The
uncleic acids and complementary sequences may also be used as DNA probes
in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect
and quantitate the presence of similar nucleic acid sequences in samples.
They may also be used to study the expression and function of secretory
proteins/membrane polypeptides and their role in metabolism. The
polypeptides may be used as antigens in the production of antibodies
adainst them and in assays to identify modulators (agonists and
activity. The antibodies may also be used as also be used as therapeutic agents to down regulate expression and
activity. The antibodies may also be used as diagnostic agents for
may also be used as therapeutic agents to down regulate expression and

The DNA sequences can be used as a probe or as a genetic marker. The protein can also be used as a marker, and to identify potential genetic disorders. The DNA and protein can also be used as nutritional sources or supplements. The protein exhibits cytokine, cell population, call differentiation activities and induces production of other cytokines in certain cell populations. The protein also exhibits immune stimulating or immune suppressing activity. It can be used in the

infections diseases caused by viral, bacterial, fungal or other infections diseases caused by viral, bacterial, fungal or other infections. The protein is also used for treating autoimmune disorders such as multiple sclerosis, systemic lupus erythematosus, and rheumatoid arbritis. It is also useful in the treatment of allergic reactions and conditions such as asthma, and in immune suppression after organ transplantation. The protein is useful in regulation of haematopoiesis and consequently in the treatment of myeloid or lymphoid cell deficiencies. It is also used in compositions for tissue growth or regeneration. The protein is also used in the treatment of nervous cor osteoarthritis and in the treatment of periodontal disease and other tooth repair processes. The protein is used in the treatment of nervous cor osteoarthritis and in the treatment of periodontal disease, and disease. They are useful for protection or regeneration and tissues. They are used for promoting or liver fibrosis, reperfusion injury in various also used for promoting or inhibiting tissue differentiation. They are also used for promoting or inhibiting therapeutic. They are used for treating various conditions resulting from coagulation activities e.g. myocardial conditions resulting from coagulation activities e.g. myocardial conditions resulting from coagulation activities e.g. myocardial conditions resulting such as receptors, receptors ligands or inhibitors or agonists of receptor/ligand interactions. They are used to treat inflammatory conditions such as septic shock, sepsis, isohaemia treperfusion injury, arthritis, and nephritis. They can be used to prevent treat inflammatory arthritis, and nephritis. They can be used to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nootropic; neuroprotective; anticonvulsant; antiparkinsonian; anti-HIV; antidabetic; immunostimulant; immunomodulator; antiinflammatory; antithyroid; immunosuppressive; nephrotropic; antigout; thyromimetic; cytostatic; antibacterial; virucide; fundicide; protozoacide; antianteriosclerotic; hepatotropic; gene therapy; infection; cancer.

                                                                                                                                               The present sequence is a human RECAP (receptors and associated proteins) polypeptide. RECAP polymucleotides and polypeptides are useful in the diagnosis, treatment and prevention of neurological disorders such as stroke, Alzheimer's disease, Pick's disease, Huntington's disease,
                                                                                                                                                                                                                   dementia, Parkinson's disease, rocks disease, and intinguous disease, constitution disease, and selectial and viral meningitis. CJD sclerosis, multiple sclerosis, bacterial and viral meningitis, CJD (Creutzfeldt-Jakob disease), GSS (Gerstmann -Straussler-Scheinker syndrome); immunological disorders, including autoimmunolinfammatory disorders such as AIDS, DiGeorge's syndrome, severe combined immunodeficiency disease (SCID). Chediak-Higashi syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis, Crohn's disease, diabetes mellitus, Good pasture's syndrome, gout, Grave's disease, hacking syndrome, whener's syndrome thyroiditis, Sjogren's syndrome, whener's syndrome, viral, bacterial, fungal, parasitic, protozoal, and helminthic infections; and cell proliferation disorders such as arteriosclerosis, atherosclerosis,
                                                       neurological disorders, immunological disorders including autoimmune/inflammatory disorders and cell proliferative disorders such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding 26 human secreted polypeptides, useful e.g. for preventing, diagnosing and/or treating cancers and for promoting wound

The present invention relates to 26 secreted human proteins. The preteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary and/or infectious diseases 8\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet coagulation disorders. polymucleotides

Claim 9; SEQ ID NO 1892; 1012pp + Sequence Listing; English.

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical

A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention New Staphylococcus aureus protein, useful as a vaccine for treating or preventing Staphylococcal infection, specifically an infection caused by Gaps Antibacterial; vaccine; gene therapy; infection; sepsis; diagnosis; enzymatic assay; antibiotic target. screening and diagnostic assays and for treating cell-.; 0 Length 322; 1; Indels 76.7%; Score 33; DB 5; I 85.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins (ABB57137-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ANYS1620-21 are encoded by the lactose operon of Lactobacillus bulgaricus, and represent a permease (AAYS1620) and beta-galactosidase (AAYS3621). The specification describes a mutant L. bulgaricus strain lacking beta-galactosidase activity, because it has a termination of nonsense) mutation in at least one of the coding sequences of the clactose operon. The resulting mutant strain is unable to ferment lactose. Since the mutant strain cannot ferment lactose, fermented milk products or produced using it do not have to be cooled to prevent post-acidification. The mutant L. bulgaricus strain of the invention is used for producing a fermented milk product, especially yoghurt. Especially, milk is fermented with a culture of the mutant strain and optionally Streptococcus thermophilus in the presence of at least one sugar assimilable by the mutant strain, preferably glucose. (Updated on 12-SEP-2003 to standardise of field)

The present invention provides human proteins and coding sequences specifically found in ovary cells. These can be used in the diagnosis and treatment of ovarian diseases, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABN87790 to ABN87882 represent human ovary specific nucleic acid (OSNA) sequences, and ABB79297 to ABB79370 represent ovary specific protein (OSP) sequences from the present invention. OSNA and OSP sequences have cytostatic activity, and can be used in vaccine production and gene therapy. An antibody that specifically binds to an OSP can be used for tracting a patient with ovarian cancer, particularly for inducing an immune response against the ovarian cancer cell expressing the OSNA or OSP. The OSNAs and OSPs can also be used for diagnosting and metastases of ovarian cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ovary specific nucleic acid; OSNA; ovary specific protein; OSP; ovary specific gene; OSG; ovarian cancer; immune response; metastasis.

                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DMA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New ovary polypeptides useful for detecting, diagnosing, monitoring, treating, staging and imaging cancers in humans having cancer and non-cancerous ovary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Sun Y,

```
The present invention provides human proteins and coding sequences specifically found in ovary cells. These can be used in the diagnosis and treatment of ovarian diseases, including cancer. The present sequence is
                                                                                                                      Human; ovary; ovarian cancer; ovarian disease; gene therapy; cytostatic.
                                                                                                                                                                                                                                                                                                                                              New ovary polypeptides useful for detecting, diagnosing, monitoring, treating, staging and imaging cancers in humans having cancer and non-cancerous ovary disease.
                                                                                                                                                                                                                                                                                                  Cafferkey R,

```
The present invention describes human secreted proteins encoded by polynucleotides obtained from adult testes, foetal brain, adult brain, brain (foetal and adult), foetal kidney, adult spleen, and adult thymus charl libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, ortokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, themenatopoiesis regulating activity, chemostatic and thrombolytic activity, receptor/ chemokinetic activity, and tumnour inhibition activity. The polynucleotides suppressor activity, and tumnour inhibition activity. The polynucleotides are also presently valuable for veterinary applications. AAZ52581 to AAZ52581 encode human secreted proteins, and AAY73390 to AAY73500 represent human secreted proteins, given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; oxidoreductase enzyme; transferase; hydrolase; lyase; isomerase; ligase; hyperproliferative disorder; immunodeficiency disorder; autoimmune disorder; neurological disorder; metabolic disorder; inflammatory disorder; cardiovascular disorder; reproductive disorder; blood-related disorder; infectious disorder; cytostatic; anti arthritic;

(HUMA-) HUMAN GENOME SCI INC.

```
The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disposals, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), disorders (e.g. phenylketomuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. hemophilia), reproductive disorders (e.g. influence) (e.g. influence) of the invention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but twipo int/pub/published_pot_sequences
                                                                                                                                              Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; oxidoreductase enzyme; transferase; hydrolase; lyase; isomerase; ligase; hyperproliferative disorder; immunodeficiency disorder; autoimmune disorder; neurological disorder; metabolic disorder; inflammatory disorder; cardiovascular disorder; reproductive disorder; blood-related disorder; infectious disorder; cytostatic; anti arthritic; nephrotropic; anticoagulant.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.

Claim 11; SEQ ID NO 1192; 1180pp; English

```
The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encolong them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. ALDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. ALDS) autoimmune disorders (e.g. arthritis), phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. nemophila), reproductive disorders (e.g. inflammatory disorders (e.g. infectious disorders (e.g. Influenza). The polymucleotides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print of the print o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zyskind JW;

(HYSE-) HYSEQ INC.

Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.

Example 6; SEQ ID NO 3484; 10078pp; English.

invention relates to human nucleic acids (AAI57798-AAI61369) and the

```
conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated to polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity, (11) a culture comprising strains in which the scent of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the compound collection of strains; or (13) identifying the target of a compound that inhibits the confidentifying proteins or screening for homologous nucleic acids are useful for a collectional and an organism. The antisense nucleic acids are useful for a collectional and an organism. The antisense modeled acids required for cellular proliferation to isolate candidate modeled acids required for collectional and an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitte. The wipo.int/pub/published_pct_sequences

immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat a polypeptide or polynucleotide system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, peripheral such as: Immune system suppression, activity, chemoteactic/chemokinetic activity, hemoteactic/chemokinetic activity, hemoteactic/chemokinetic activity, hemoteactic/chemokinetic activity, hemoteactic/chemokinetic activity, hemoteactic/chemokinetic activity, arthritis and inflammation, leukaemias and constant activity arthritis and inflammation, leukaemias and constant activity activity, arthritis and inflammation, leukaemias and constant activity activity, arthritis and inflammation, leukaemias and constant activity activity arthritis and inflammation, leukaemias and constant activity activity activity activity arthritis activity acti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAO19623
ID AAO1
XX
     The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymodeotides are useful in gene therapy. A composition containing a polypeptide or polymocleotide of the invention may be used to treat disease of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and contral nervous system diseases, such as a localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic therapt activity and Shy-Drager Syndrome. Other uses include the utilisation of the activity, enectactic/chemckinetic activity, haemostatic activity, haemostatic activity, haemostatic activity, haemostatic activity, archititis and therapy, drug screening, assaays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form bart of the printed specification

This sequence represents a renal NADPH oxidase polypeptide, (Renox polypeptide). Renox shows homology with murine phagocyte NADPH oxidase homology 1991-phox. Renox contains all the conserved structural features required for NADPH oxidase activity, including the six membrane spanning regions, FAD binding site, NADPH binding motifs and proposed haem binding histidines. Renox, and the DNA encoding it, are useful for treating or preventing cancer, proliferative fidiseases, hypertension, inflammatory kidney disease, infections of urinary tract and polycythemia. The DNA is useful in gene therapy and for preparing transgenic constructs to be introduced into non-human animals, and thus to generate the transgenic animals. Renox is useful for producing antibodies that selectively binds to Renox polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid molecule encoding renal NADPH oxidase, termed as Renox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptide, useful for treating or preventing cancer, hypertension,
polycythemia, inflammatory kidney diseases and urinary tract infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention provides the protein and coding sequences of human NADPH oxidases designated Nox 4 and Nox 5. These proteins are capable of stimulating superoxide production, and thus are involved in the production of reactive oxygen intermediates. The proteins are therefore useful in the treatment of cancers, psoriasis, cardiovascular disease, atherosclerosis, hypertension, restenosis and prostatic hypertrophy. The present sequence is the human nox 4 enzyme
                                                                                              cytotoxic; mutagenic; cancer; cardiovascular disease; NADPH oxidase; atherosclerosis; hypertension; prostatic hypertrophy; restenosis;
                                                                                Human; Nox; enzyme; reactive oxygen intermediate; cell division;
                                                                                                                                                                                                                                                                                                                                                                                                                          New nicotinamide adenine dinucleotide phosphate-oxidase protein, fragments, or conservative substitutions, useful for stimulating superoxide production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, pain, neuronal tissue, gene therapy,

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, and exrivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynucleotide, a host cell which is differentially regulated in an animal subjected to pain and a tray, a method for identifying a nucleotide sequence which is differentially expressed in neuronal tissue of a first animal that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal complected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition computing the one or more of pain and a pharmaceutical composition computates its activity is useful for preparing a medicament for treating pain and spared nerve injury (Chung), chronic constriction configuration, and sequence presented is a human protein (e.g. gene conjugation), the sequence presented is a human protein (e.g. gene conjugation), but was obtained in electronic form directly from WIPO at the sint in the sequence data for this patent did not form part of the printed print in the subjection in the sequence of the sequen
                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologus promoter, so that expression of the second allele by the recombination, of a promoter replacement fragment with a heterologus promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles modified are modified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that constributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a fungus to an antifungal agent that inhibits the growth of a diploid fungus of its agent, an antifungal agent that inhibits the growth of a diploid fungus of a gene product, preferably enzymatic activity, carbon cranslational, signal transduction, DNA replication and cell division crivity of a gene product, preferably enzymatic activity, are method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed the Enronean parent office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 44; SEQ ID NO 7890; 167pp + Sequence Listing; English.

beta-galactosidase (EC 3.2.1.23) - Lactobacillus delbrueckii subsp. bulgaricus

beta-galactosidase (EC 3.2.1.23) - Lactobacillus delbrueckii subsp. bulgaricus

Cispecies: Lactobacillus delbrueckii subsp. bulgaricus

Cispecies: Lactobacillus delbrueckii subsp. bulgaricus

Cibate: 21-May-1990 #sequence_revision 21-May-1990 #text_change 15-Oct-1999

Cispecies: A30003; R.M.; Requadt, C.; Power, S.; Mainzer, S.E.

J. Bacteriol. 171, 625-635, 1989

A;Title: Expression and nucleotide sequence of the Lactobacillus bulgaricus beta-galactos

A;Reference number: A30093; MUID:89123132; PMID:2492511
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·;

Rivavello, T.
Submitted to the EMBL Data Library, November 1995
A.Description: The sequence of C. elegans cosmid C46H3.
A.Reference number: 218409
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: DAA
A.Status: 1-215 <PAV>
A.Residues: 1-215 <PAV

SUBUNIT: Interacts with the N-terminal region of APS.

SUBUNIT: Interacts with the N-terminal region of APS.

NEURILIUMAR LOCATION: Cytoplasmic.

LYBERLALICHER LOCATION: Cytoplasmic.

Event=Alternative initiation;

Comment=3 isoforms, p66shc (shown here), p52shc and p46shc, are produced by alternative initiation;

Produced by alternative initiation;

-!- TISSUE SPECIFICITY: Widely expressed.

-!- DOMAIN: The PID domain specifically binds to the Asn-Pro-Xaa-TY(P) motif found in many tyrosine-phosphorylated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              X-RAY CRYSTALLOGRAPHY (2.7 ANGSTROMS) OF 482-583.

Genome 12:852-861(2001).
-!-FUNCTION: May play a role in cross-linking cytoskeletal proteins by binding intermediate filaments to the N-terminal plectin repeats and microtubules to the C-terminus.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                               Obermaier B., Piravandi E., Rinke M., Domdey H.;
Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Septum formation and repair, especially under certain
                                                                                                                                                                                                                                                                 glucosaminyl) | (N+1).
BNZYME REGILATION: Requires proteolytic activation.
SUBCELLULAR LOCATION: Plasma membrane-bound.
MISCELLANBOUS: At least 4 potential membrane-spanning regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens (Human).
